IN THE CLAIMS

- 1 (Currently Amended). A method comprising:
writing back to a disk two non-sequential writes as one write operation request.
- 2 (Original). The method of claim 1 including identifying dirty logical data.
- 3 (Original). The method of claim 2 including identifying dirty logical block addresses.
- 4 (Original). The method of claim 1 including flushing different cache lines in the same operation.
- 5 (Original). The method of claim 1 including writing back data from a non-volatile cache.
- 6 (Original). The method of claim 1 including searching for dirty data to write back.
- 7 (Original). The method of claim 6 including searching in a first direction.
- 8 (Original). The method of claim 7 including searching in a second direction opposite the first direction.
- 9 (Original). The method of claim 6 including searching by sets and ways in a cache organized in sets and ways.
- 10 (Original). The method of claim 6 including determining whether two logical blocks of data that are dirty are sufficiently proximate to write them back to the disk drive write back in the same operation.

11 (Currently Amended). An article comprising a medium storing instructions that, if executed, enable a processor-based system to:
write back to a disk data from two non-sequential writes as one write ~~operation~~
request.

12 (Original). The article of claim 11 further storing instructions that, if executed, enable the processor-based system to identify dirty logical data.

13 (Original). The article of claim 12 further storing instructions that, if executed, enable the processor-based system to identify dirty logical block addresses.

14 (Original). The article of claim 11 further storing instructions that, if executed, enable the processor-based system to flush different cache lines in the same operation.

15 (Original). The article of claim 11 further storing instructions that, if executed, enable the processor-based system to write back data from a non-volatile cache.

16 (Original). The article of claim 11 further storing instructions that, if executed, enable the processor-based system to search for dirty data to write back.

17 (Original). The article of claim 16 further storing instructions that, if executed, enable the processor-based system to search in a first direction.

18 (Original). The article of claim 17 further storing instructions that, if executed, enable the processor-based system to search in a second direction opposite the first direction.

19 (Original). The article of claim 16 further storing instructions that, if executed, enable the processor-based system to search by sets and ways in a cache organized in sets and ways.

20 (Original). The article of claim 16 further storing instructions that, if executed, enable the processor-based system to determine whether two logical blocks of data that are dirty are sufficiently proximate to write them back to the disk drive in the same write back operation.

21 (Currently Amended). A system comprising:

a cache;

a disk drive coupled to said cache; and

a controller to write back to a disk two non-sequential writes as one write operation

request.

22 (Original). The system of claim 21, said controller to identify dirty logical data.

23 (Original). The system of claim 22, said controller to identify dirty logical block addresses.

24 (Original). The system of claim 21, said controller to flush different cache lines in the same operation.

25 (Original). The system of claim 21, said controller to write back data from a non-volatile cache.

26 (Original). The system of claim 21, said controller to search for dirty data to write back.

27 (Original). The system of claim 26, said controller to search in a first direction.

28 (Original). The system of claim 27, said controller to search in a second direction opposite the first direction.

29 (Original). The system of claim 26, said controller to search by sets and ways in a cache organized in sets and ways.

30 (Original). The system of claim 26, said controller to determine whether two logical blocks of data that are dirty are sufficiently proximate to write them back to the disk drive in the same write back operation.
